

### *aFe Differential Cover Installation*

1. Position the cover and factory gasket by aligning the bolt holes. Using the 25mm long socket head cap screws and washers, loosely install all 10 screws. Skip the two holes that the emergency brake bracket and brake line bracket secure to.
2. Install a washer and spacer into the last two holes, then using a 30mm long socket head cap screw and a washer, secure the brake line bracket and emergency brake bracket.
3. Using a 8mm Allen socket, torque all socket head cap screws to 12-16 ft. lbs. in a cross tightening pattern.
4. Using a 14mm socket, install the drain plug and crush washer into the aFe differential cover.

5. Apply Teflon (PTFE) pipe sealant tape on the threads of the NPT plug components before installing.
6. Install the 1" NPT plug or sight glass in the passenger side of the aFe differential cover.
7. Fill the aFe differential cover with new gear oil. Gear oil will run out of the 1/8 NPT hole on the driver's side of the aFe differential cover when it is filled. Install the provided 1/8 NPT plug in the oil level hole and tighten.

**When installing kit number 46-70302 only:**

8. Install the supplied 6" deep reach magnet in the top fill hole and tighten using 1/2" ratchet torque wrench. DO NOT OVER TIGHTEN.

**When installing kit number 46-70300 only:**

9. Install the supplied 3/4" NPT plug in the top fill plug hole and tighten using 1/2" ratchet torque wrench. DO NOT OVER TIGHTEN.

**NOTE:** If your vehicle has been modified or "lifted" and the axle has been rotated, you will need to establish the correct oil level for your vehicle.

**NOTE:** If fluid is overfilled, it can be drained to the proper level through the side oil level port.

10. Your installation is now complete. Drive at least 25 miles and check oil level using aFe sight glass and fill if necessary.
